NortekUSA Overview

Nortek-AS (1996)
Oslo, Norway

NortekUSA (1999)
Annapolis, MD

- Current Meters
- Current Profilers
- Wave Gauges
- Velocimeters
- River Measurements

www.NortekUSA.com

Options for Wave Measurements

- **Aquadopp Current Meter (PUV)**
- **Aquadopp Profiler (PUV)**
- **Vector Velocimeter (PUV)**
- **AWAC (AST-MLM)**

Aquadopp Current Meter

- Measures current velocity in one cell
- Measures waves at 1 Hz maximum
- Optional transducer head config.

Aquadopp in Shallow Water

Turn Aquadopp upside down
Measure in XYZ coordinates
Discard beam hitting bottom
Works in 50 cm

Aquadopp in Shallow Water

Optional “right angle” transducer

Works in 2 m water

Easy to deploy

Low flow disturbance

Upgradeable to Profiler

Aquadopp Profiler

- Measures velocity profile 128 cells
- Measures waves at 2 Hz maximum
- Acoustic profile range up to 50 m
- Minimum cell size 10 cm
- Optional transducer head config.
- **NEW: High Resolution Profiler**
2 m range with 2 cm cells
(firmware upgrade)

Vector Velocimeter

- Measures velocity in small cell ($\sim 1 \text{ cm}^3$)
- Measures at 64 Hz maximum
- Suitable for turbulence measurements
- Interface with turbidity sensor
- Study sediment suspension in sea grass

Vector Velocimeter

- **Bottom mounted**
- **Surface mounted**

AWAC

- AWAC (Acoustic Wave And Current) profiler
- Profiles current velocity in 128 cells
- Measures wave height with AST (Acoustic Surface Tracking) at 4 Hz
- Measures wave direction with MLM (Maximum Likelihood Method) at 2 Hz
- Works well in deep water

PUV Methodology

PUV Wave Height: Inferred Estimates

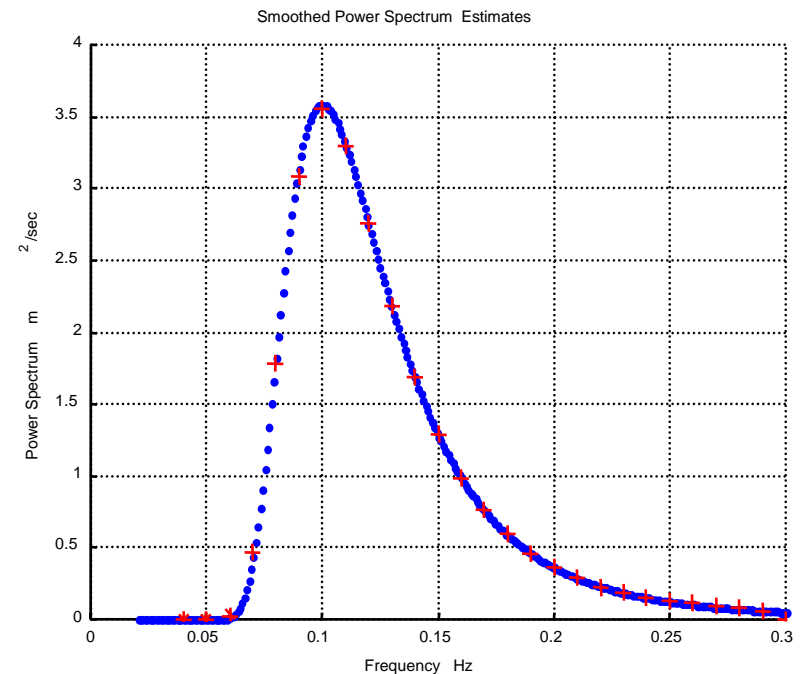

Measure time series of pressure

Transform time series into power spectra

$$H_s = 4\sqrt{\text{area}}$$

- Well accepted and robust method
- Problem for transient waves
- Problem for non-linear waves

AWAC Wave Height: Direct Measurements

Measure time series of surface position (AST)

Method 1: Time Domain

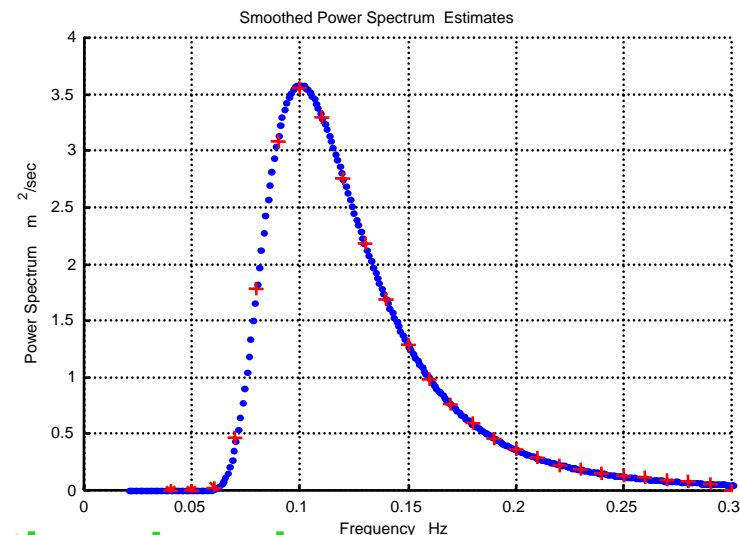

H_s is the “*mean of the 1/3 largest waves in a record*”

Method 2: Frequency Domain

Transform time series into
power spectra

$$H_s = 4\sqrt{\text{area}}$$

- Direct measurement of wave height
- Can measure H_{\max}
- Study non-linear/transient waves in time domain

Wave Measurement Considerations

- **Pressure & velocity attenuation with depth (PUV vs. AST-MLM)**
- **Sampling frequency**
- **Sampling duration**
- **Trying to capture ship wakes**
- **Energy spectra and directional limitations**

Attenuation of wave properties

PUV Limitations

- **2.5 second (0.4 Hz) wave is fastest that can be measured in 3 m of water**
- **Are faster waves present in region?**

Depth	Period	Hs
20	5.8	0.75
20	6.4	0.60
20	7.2	0.35
20	8.3	0.30
20	10.1	0.20
15	5.0	0.50
15	5.5	0.40
15	6.2	0.25
15	7.1	0.20
15	8.7	0.15
10	4.1	0.40
10	4.5	0.30
10	5.0	0.20
10	5.8	0.15
10	7.1	0.10
5	2.9	0.20
5	3.2	0.15
5	3.6	0.10
5	4.1	0.07
5	5.0	0.05
3	2.3	0.12
3	2.5	0.10
3	2.8	0.05
3	3.2	0.04
3	3.9	0.03

Sampling Frequency

- Nyquist frequency is important to consider
- If you sample a 1 Hz,
the fastest wave you can resolve is 2 sec (0.5 Hz)
- If you sample a 2 Hz,
the fastest wave you can resolve is 1 sec (1 Hz)
- If you sample a 4 Hz,
the fastest wave you can resolve is 0.5 sec (2 Hz)

Sampling Duration

- Combination should amount to *Well Sampled*
- 100 wave cycles sampled per burst
- Example 5 sec period requires min 8.5 minutes

	512	1024	2048
1 Hz	8.5 min	17 min	35 min
2 Hz	4.25 min	8.5 min	17 min

Sampling Duration

Ideal:

Ship wake to dominate signal

Compromise:

**Long duration burst to
“well sample” background
waves**

- VS -

**Short duration burst to
maximize ship wake signal**

Tampa Bay AWAC Burst 391
7/22 0219 hours

Directional Limitations

Directional ability is a function of velocity and pressure (PUV) or AST (AWAC) measurements

PUV method is most limited by pressure attenuation

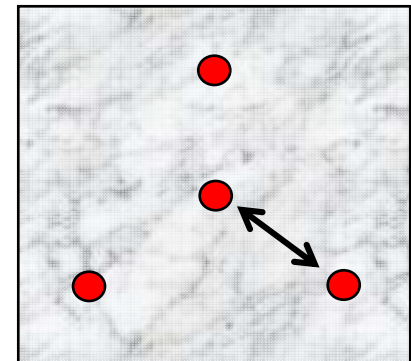

At 3 m depth, pressure attenuation limits frequency (and thus direction) resolution to 2.5 sec (0.4 Hz)

AWAC directional estimates are limited by array geometry

Must measure velocity at two places on each wave, so array spacing limits wave length and wave period resolution

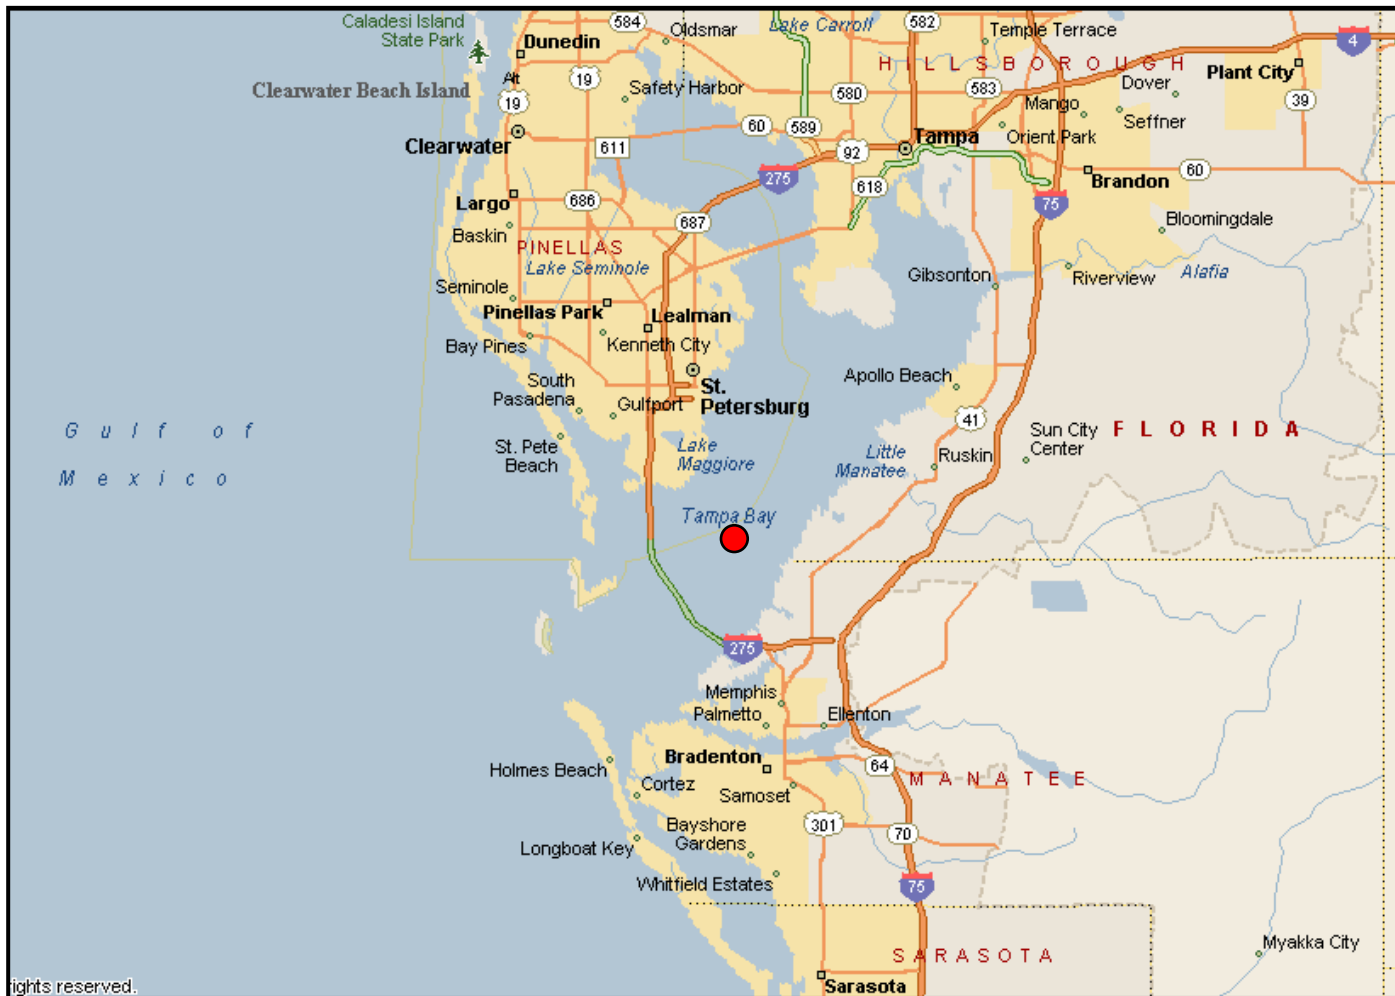

At 3 m depth, array spacing is 0.8 m, minimum wave length is 1.8 m, and thus directional resolution is limited to 1 sec (1 Hz)
